

This is the front end for the Tunnel Boring Machine for the Diggeridoos. I made the layout of the page, and implemented the TBM Status component (top right corner), and am currently implementing the Load Sensors component. The TBM Status component utilizes a button that was imported from React Bootstrap, and has capabilities of being disabled in certain states of the machine. The distance bar gathers information from the backend and makes the necessary calculations to display the distance the machine has drilled.
