

This is my social media engagement analyzer project. This project was created in Java, and takes in a CSV file that contains engagement rates from a variety of social media influencers. The program offers the option to sort the data parsed by only displaying the month of January, only February, only March, or all three months at once. On each click, the data is put through a comparator and the bars are updated accordingly depending on the level of engagement each influencer had for the months. All of this data is then relayed to the GUI which updates the window as needed.
